

# 30 ft. Dome Frame Instructions

## You will need:

- a couple of friends
- a couple of 12-14 ft. ladders or simple scaffolding (top bolt is 15 ft. high)
- a couple of 9/16" wrenches\*

\*Ratchet wrenches make the job easier, but normal wrenches will work fine. A drill with a 9/16" socket tip will speed things up.

**In this kit you will receive:**

30 'A' struts	30 'D' struts
90 'B' struts	30 'E' struts
70 'C' struts	

## Color coding the struts:

The 30 ft. dome frame has 250 struts in 5 different lengths. Each strut is marked with a letter 'A' through 'E' at one or both ends. The number 5 tells us that it is a 30 ft. dome strut. To help make it clearer as you are erecting the frame, color code each strut with the provided stickers. Put the sticker in the middle of each strut facing the inside of the dome. Double check each strut while you are putting up the frame.

## Assembly:

*NOTE:* It is easier to set up your frame off the deck as long as you have enough people to help lift it back on when complete. If you are setting up on your deck, temporarily nail a brace board to all perimeter boards to hold frame on deck.

Start at the bottom, bolting the struts together as you go. Complete each row before you move up to the next. The large washer is positioned on the outside of the struts to cover any sharp edges. Use the small washers for the bottom row. Do not tighten the bolts until the entire frame is together because you will be unbolting and adding more struts. We find this much easier than trying to bolt all the struts on at once. Add the upper struts to the outside of the bolt, closest to the large washer to enable the dome skin to slide on easily. Let the upper struts hang down until you are ready to add to them, to avoid bending the strut ends.

**Use the written instructions below if they are helpful to you. Some people find it easier to set up by just following the frame diagram. Watch the dome construction section of the Pacific Domes video before assembling your frame and putting on the dome skin.**

- Begin by bolting the base and sides of Row 1 together.  
There will be four strut ends at each bolt. There will be 20 bolts.
- Add the Base of Row 2 to the Apex of Row 1, bolting together loosely.  
There will be four strut ends at each bolt. There will be 20 bolts.  
If you add 2, then skip 1 all the way around, and then go back and add the 1, it will be easier to raise your side wall.
- Unbolt and add the sides of Row 2 to each of these bolts.  
Remember to add them to the outside of the bolt. Let them hang down until you add the Base of Row 3.
- Add the Base of Row 3 to the Apex of Row 2.  
There will be four strut ends at each bolt. There will be 20 bolts.
- Unbolt and add the sides of Row 3 to each of these bolts.  
Remember to add them to the outside of the bolt. Let them hang down until you add the Base of Row 4.
- Add the Base of Row 4 to the Apex of Row 3.  
There will be four strut ends at each bolt. There will be 15 bolts.
- Unbolt and add the sides of Row 4 to each of these bolts.  
Remember to add them to the outside of the bolt. Let them hang down until you add the Base of Row 5
- Add the Base of Row 5 to the Apex of Row 4.  
There will be four strut ends per bolt. There will be 10 bolts.
- Unbolt and add all of Row 6 to the Apex of Row 5. There will be 5 bolts.  
While you are adding the 5 center 'A' struts, sandwich them in between the other struts. (*Do not put them on the outside.*) This will enhance the integrity.
- Join the Pentagon with a single bolt at the top of the frame.  
Now you are ready to tighten all the bolts.

**HINTS!** – If at any time you notice the strut ends are not bolting together smoothly and easily as you're erecting the frame, this is because the base of the frame is not plane and not perfectly round (30 ft. diameter). Don't be frustrated. Take time to adjust the base of your frame. This will influence any part further up that you're working on. Use your tape measure.
